Data flows

IFI/ Donor

IFI / Donor

- One-off survey-based initiatives to support planning and to track progress
- Limited co-ordination to support improvements in city-level data infrastructure

State / Province / District

Urban Local Govt
Responsible for service planning and delivery

NATIONAL

- Data reporting requirements (e.g., SBM, NSC, UGIIP) focus on infrastructure construction, esp. toilets
- Data sets are often aggregated and lumpy and do not reflect service realities in cities
- Limited accountability mechanisms to drive improvements against service levels; lack of performance targets and enforcement
- Limited guidance or resources to strengthen city level data infrastructure

tly collects

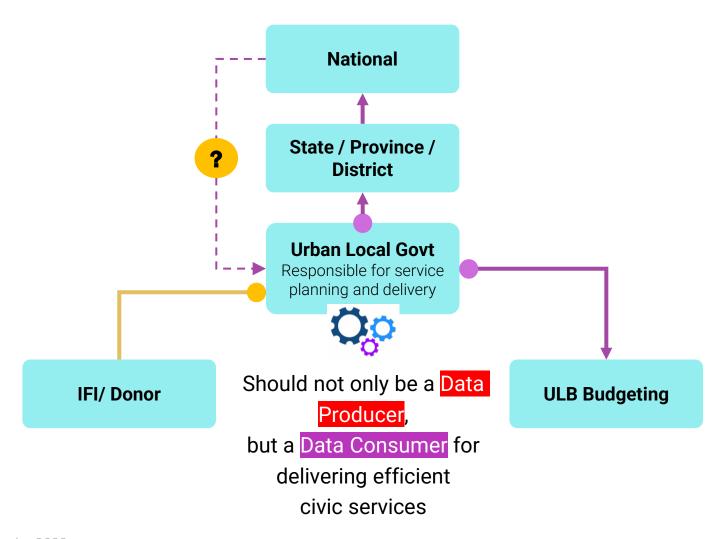

ULB Budgeting

Census is the only dataset that consistently collects 100% ULB-wide Service Level Data. It is also the main dataset that cities rely upon for service planning. Own data collection initiatives are very limited, and mostly related to revenue generation or expenditure for budgeting, e.g., tipping fee collection, municipal desludging service records

Setting the context for today's discussion

 National MIS systems are useful for sustained data generation at scale, but of poor quality and ineffective when they are not tied to a clear accountability and resourcing framework

 The quality and sustainability of service data systems is directly correlated to how useful it is to the producers of data and the ease and cost of collecting it.
